Rapport nr. 1709/F	~~Åpen~~/Fortrolig ~~til~~ inntil videre

Tittel:
Geokjemiske bekkesedimentundersøkelser i Nord-Gudbrandsdalen

Oppdragsgiver: NGU - A/S Nordalsmalm	**Forfatter:** Reidar Krog
Forekomstens navn og koordinater:	**Kommune:** Dovre, Lom, Sel og Vågå
Fylke: Oppland	**Kartbladnr. og -navn (1:50 000):** 1419 II, 1518 III, 1618 I, 1618 II, 1718 I, 1718 II, 1718 III, 1718 IV
Utført: Prøvetaking: 1979 og 1981 Rapportering: 1983	**Sidetall:** 74 **Tekstbilag:** 5 Kr. **Kartbilag:** 12

Prosjektnummer og -navn:
1709 Nord-Gudbrandsdalsprogrammet

Prosjektleder: Einar Tveten

Sammendrag:

Som en del av undersøkelsene under Nord-Gudbrandsdalsprogrammet ble det i 1979 og 1980 utført en geokjemisk bekkesedimentundersøkelse i området Otta-Vågå og på Sognefjellet.

Undersøkelsen førte til flere anomalier. Denne rapporten omhandler resultatene fra den regionale bekkesedimentundersøkelsen. Den videre oppfølging av de anomale verdiene er ikke tatt med her, men omhandles i rapportene 1709/I , 1709/L og 1709/P.

Nøkkelord	Geokjemi	
	Bekkesedimenter	
	Malm	

Ved referanse til rapporten oppgis forfatter, tittel og rapportnr.

1. INNLEDNING

I forbindelse med leting etter mineralske råstoffer i Nord-Gudbrandsdalen ble det i 1979 og 1980 utført en geokjemisk bekkesedimentundersøkelse i området Otta-Vågå og på Sognefjellet. De geokjemiske undersøkelsene var først og fremst rettet mot kisforekomster, og leteområdene ble derfor lagt til de kambrosiluriske bergartene som kan inneholde slike forekomster. Tegning 1709/F-01 viser beliggenheten av denne undersøkelsen i forhold til tidligere tilsvarende undersøkelser i området. I tillegg til de skraverte områdene har Nord-Gudbrandsdalsprogrammet også utført kompletterende prøvetaking innen et par små områder på vestsida av A/S Folldal Verk sitt tidligere prøvetatte område, se tegning 1709/F-04. Hensikten med en slik kompletterende prøvetaking var hovedsaklig å lete etter eventuelle blymineraliseringer på grensen mellom kambrosiluriske og eokambriske bergarter.

Denne rapporten omhandler resultatene fra den regionale bekkeseidmentundersøkelsen i 1979 og 1980. Den videre oppfølging av de anomale resultatene fra denne undersøkelsen er imidertid ikke tatt med i denne rapporten, men omhandles dels i NGU-rapport nr. 1709/I (Rønning, Krog og Nilsson 1983) og dels i NGU-rapport nr. 1709/L (Rønning, Krog og Nilsson 1983) og dels i NGU-rapport nr. 1709/P (Rønning, Krog og Nilsson 1983).

2. FELTDATA

De detaljerte områdegrensene for denne undersøkelsen framgår av prøvenummerkartene 1709/F-02, 1709/F-03 og 1709/F-04. Et område som stort sett avgrenses av en linje Sel - Vågåmo - Tesse - Randsverk - Sel ble prøvetatt i 1979, og de øvrige områdene ble

prøvetatt i 1980. Det prøvetatte arealet utgjør tilsammen ca. 800 km^2. Feltarbeidet ble i 1979 utført i tidsrommet 6. juni til 3. august og i 1980 fra 7. juni til 19. august. I alt ble det til selve prøvetakinga brukt ca. 340 dagsverk. Følgende skoleelever og studenter var engasjert i prøvetakinga: Bjarne Bakken, Einar Sverre Berg, Joar Berg, Bjørg Johansen, Jan Ivar Krog, Stein Inge Moen, Bjørn Næss, Ingrid Olesen, Kolbjørn Rusten, Bjarne Rønningen, Bjørn og Marit Vorkinn. Arbeidet ble ledet av Reidar Krog fra NGU. Bortsett fra de største elvene ble sedimentprøver samlet inn fra alle tilgjengelige bekker og elver i områdene. Avstanden mellom prøvestedene var ordinært 250 m i alle områder. Ved hvert prøvested ble tatt én prøve midt i bekken. Ved større bekker, hvor det var vanskelig å få tak i midtprøve, ble prøven tatt minst én meter fra bredden. På stedet ble prøven våtsiktet gjennom nylonduk med lysåpning 180 mikron (0.18 mm). Bare finfraksjonen ble tatt vare på. Prøvene ble oppbevart i papirposer som senere ble plassert i tørkeovn og tørket ved ca. 50°C. Totalt ble det samlet inn 3253 bekkesedimentprøver ved denne undersøkelsen.

3. ANALYSEMETODER

Prøvene ble oppsluttet og analysert ved NGU. Ett gram av prøvene ble veid inn i reagensglass og behandlet med 5 ml salpetersyre 7N i vel 3 timer ved ca. 110°C. Etter tilsats av referanseelementene Y og Li og fortynning til 100 ml, ble følgende 20 elementer bestemt i løsningen med plasmaspektrometer: Si, Al, Fe, Ti, Mg, Ca, Na, K, Mn, Cu, Zn, Pb, Ni, Co, V, Mo, Cd, Cr, Ba og Sr. Reproduserbarheten av analysene er omlag ±15% ved 95% konfidensnivå.

Samme oppslutningsprosedyre som ovenfor ble benyttet ved undersøkelse av Ag og Be-innhold i prøvene. Her ble imidertid et ato-

mabsorpsjonsinstrument benyttet ved bestemmelse av analyseverdiene i løsningen. Uran ble bestemt fluorimetrisk etter oppslutting av 0.25 g prøve i 5 ml varm 4N salpetersyre i 2 timer.

4. FRAMSTILLING AV RESULTATER OG ARKIVERING

Ved den geokjemiske bekkesedimentundersøkelsen i Nord-Gudbrandsdalen ble topografiske kart i målestokk 1:50 000 brukt ved arbeid i felten og UTM-rutenettet på disse kartene ble brukt ved koordinatfesting av prøvepunktene. I bilag 1 er satt opp prøvenummer, koordinater og analyseverdier for de aller fleste av bekkesedimentprøvene. Noen få bekkesedimentprøver fra området til Folldal Verk er satt opp med prøvenummer og analyseverdier i bilag 2. De eneste analyseresultatene som ikke er tatt med i disse tabellene er Ag og Be-resultatene som alle ligger rundt eller under påvisningsgrensen for disse elementene. De kan skaffes ved henvendelse til NGU. Opplysningene ligger forøvrig lagret på tape ved NGUs dataanlegg, se tekstbilag 4.

Ved opptegning av resultatene ble brukt det samme kartgrunnlaget som ved arbeidet i felten. Prøvenumrene er inntegnet på tre forskjellige kartbilag: 1709/F-02 "Otta-Vågå", 1709/F-03 "Sygnefjell" og 1709/F-04 "Nord for Vågåvatn" og "Muslidalen". Av disse inneholder de to første kartbilagene prøvepunktene ved den regionale prøvetakingen. Det siste kartbilaget inneholder bare noen få kompletterende prøvepunkt i forbindelse med A/S Folldal Verk sine tidligere undersøkelser. For de to første områdene "Otta-Vågå" og "Sygnefjell" er det framstilt resultatkart for hvert av analyseelementene, bortsett fra Ag, Be og Cd, tilsammen 40 kart. For de små områdene "Nord for Vågåvatn" og "Muslidalen" er det ikke framstilt resultatkart. På resultatkartene er sporelementinnholdet i hver prøve framstilt ved et symbol. Størrelsen av symbolet angir størrelsen av analyseverdien. Resultatkartene er

tegnet ved hjelp av edb på en Calcomp-plotter. På hvert kart er også et diagram som viser den kumulative frekvensfordeling av vedkommende element. Diagrammet har langs den ene aksen antall prøver i % og langs den andre analyseverdier. En prosent med motsvarende analyseverdi angir hvor mange prosent av prøvene som har lavere elementinnhold enn denne analyseverdien. Av plasshensyn er bare resultatkartene til de fire elementene Cu, Ni, Zn og Pb for de to områdene "Otta-Vågå" og "Sygnefjell" tatt med i denne rapporten, kartbilag 1709/F-05 til 1709/F12. De øvrige resultatkartene kan skaffes ved henvendelse til NGU. En tabell over alle geokjemiske kart innen Nord-Gudbrandsdalsprogrammet er satt opp i tekstbilag 3. Oversikten omfatter både de regionale kart knyttet til denne rapporten og oppfølgingskartene knyttet til andre delrapporter innen programmet. Tekstbilag 4 gir en tilsvarende oversikt over alle innsamlede geokjemiske prøver innen Nord-Gudbrandsdalsprogrammet. De oppbevares under prosjektnummer 1709 ved Geokjemisk avdeling NGU. I tillegg til de prøvene som er angitt i denne oversikten kommer prøver innsamlet i forbindelse med det geologiske feltarbeidet. De omtales under de geologiske beskrivelsene og oppbevares ved Geologisk avdeling, NGU. Tekstbilag 5 viser korrelasjonskoeffisientene mellom analyseresultatene til de mest aktuelle elementene ved denne undersøkelsen.

5. RESULTATER

Aluminium Tegning 1709/F-13 og 1709/F-14. Tegningene er ikke vedlagt rapporten, men kan skaffes fra NGU. Sedimentprøvene har en medianverdi på ca. 1.3% Al og de fleste har verdier mellom 0.5 og 2% Al. Verdiene varierer relativt lite og ligger på det samme

nivå i de to hovedområdene "Otta-Vågå" og "Sygnefjell". Aluminium er et svært vanlig bergartsdannende element som finnes i store mengder i de fleste bergarter. Bare en liten del av det totale Al-innholdet i bekkesedimentene løses ut med den anvendte analysemetoden og analyseverdiene angir derfor ikke totalinnholdet i prøvene. Fordelingen av aluminium innen det prøvetatte områder tillegges ikke særlig vekt ved denne typen undersøkelser og aluminiumsverdiene er tatt med her fordi analyseinstrumentet automatisk bestemmer disse verdiene samtidig med de andre elementverdiene.

Barium Tegning 1709/F-15 og 1709/F-16. Tegningene er ikke vedlagt rapporten, men kan skaffes fra NGU. Sedimentprøvene har en medianverdi på ca. 100 ppm Ba og de fleste prøvene har verdier mellom 30 og 300 ppm Ba. Enkelte verdier er svært høye, helt opp i 0.23% Ba ved Tesse (nr. 1398) og 0.15% Ba ved Veggemskapmen (nr. 456), se tegning 1709/F-02. Det tungtløselige saltet bariumsulfat gjør at høye bariumverdier ofte opptrer i forbindelse med sulfidforekomster, men kan også opptre i andre sammenhenger som f.eks. plagioklas-feltspat som finnes over alt og særlig i Jotunheimen. Forøvrig tillegges ikke bariumverdiene særlig vekt ved denne typen undersøkelser.

Beryllium Elementet er ikke framstilt på kart. De fleste konsentrasjonene av dette elementet ligger under følsomhetsgrensen på 1 ppm Be og bare 10 prøver inneholder 2 ppm Be som er den høyeste målte konsentrasjonen. Alle prøvene med 2 ppm Be kommer fra området Raphamn-Gråhø som ligger omlag 5 km nordøst for Otta. Disse resultatene er ikke så høye at det tillegges særlig vekt og de er derfor ikke framstilt på kart.

Bly Tegning 1709/F-08 og 1709/F-12. Tegningene er vedlagt rapporten. Sedimentprøvene har en medianverdi på ca. 8 ppm Pb og ca. 90% av prøvene har lavere verdier enn 20 ppm Pb. Det har liten hensikt å skille mellom blyverdier under 20 ppm Pb på grunn av analysemetodens dårlige reproduserbarhet ved så lave verdier. Den høyeste blyverdien er på 286 ppm Pb og opptrer ved Skaalavatnet sammen med enkelte andre forholdsvis høye verdier, tegning 1709/F-12. Ikke fult så høye blyverdier opptrer 5-6 km lenger mot NØ, ved Dummdalen, men også her inneholder én prøve 232 ppm Pb.

Innenfor områder "Otta-Vågå" er det hovedsaklig området Vålåsjøberget-Pungen som skiller seg ut med opptil 270 ppm Pb. Dette området ligger 6-7 km øst for Otta. Dessuten opptrer en enkelt blyverdi på 80 ppm Pb ved Haldorpiggen, ca. 5 km NV for Otta.

Jern Tegning 1709/F-17 og 1709/F-18. Tegningene er ikke vedlagt rapporten, men kan skaffes fra NGU. Sedimentprøvene har en medianverdi på ca. 2.2% Fe og de fleste prøvene har verdier mellom 1 og 5% Fe. Jern er et vanlig bergartsdannende element som opptrer i så store mengder at det ikke kan brukes som sporelement i letingen etter jernforekomster. Likevel kan jernverdien være til nytte som indikator for utfellingsbelegg som ofte kan skape falske anomalier i bekkesedimentundersøkelser.

Kadmium Konsentrasjonene av dette elementet er svært lave med over 99% av analyseverdiene under følsomhetsgrensen på 1 ppm Cd. Det er derfor ikke framstilt kart over dette elementet. Den høyeste Cd-konsentrasjonen har prøve nr. 3264 med 8 ppm Cd. Den opptrer ca. 3 km SØ for Flatingen, tegning 1709/F-02. Den nest høyeste er på 6.4 ppm Cd og opptrer ved Vålåsjøberget som ligger noen km øst for Otta, prøve nr. 2364.

Kalsium Tegning 1709/F-19 og 1709/F-20. Tegningene er ikke vedlagt rapporten, men kan skaffes fra NGU. Sedimentprøvene har en medianverdi på ca. 0.6% Ca og de fleste prøvene har verdier mellom 0.2 og 1.5% Ca. Kalsium er et vanlig bergartsdannende element som vanligvis ikke nyttes som sporelement i letingen etter malmforekomster. Variasjonene i kalsiumverdiene skyldes oftest varierende karbonatinnhold i bergartene og verdiene kan brukes i bergartskartlegging.

Kalium Tegning 1709/F-21 og 1709/F-22. Tegningene er ikke vedlagt rapporten, men kan skaffes fra NGU. Sedimentprøvene har en medianverdi på ca. 0.2% K og de fleste prøvene har verdier mellom 0.05 og 0.5% K. Området ved Sognefjell har noe høyere kaliumverdier enn området "Otta-Vågå". Kalium er et vanlig silikatbundet bergartsdannende element, men bare en liten del av det totale K-innholdet i bekkesedimentene løses ut ved den anvendte analysemetoden. Elementet brukes ikke som sporelement i malmletingsundersøkelser av denne typen.

Kobber Tegning 1709/F-05 og 1709/F-09. Tegningene er vedlagt rapporten. Sedimentprøvene har en medianverdi på ca. 35 ppm Cu og de fleste prøvene har verdier mellom 10 og 100 ppm Cu. Veltegodset fra de gamle Selsgruvene ligger like øst for Otta og forurenser de nærmeste bekkesedimentprøvene med verdier opp i 4000 ppm Cu. Bortsett fra disse forurensningene opptrer den høyeste kobberverdien med ca. 600 ppm Cu ved Svarttjern, ca. 13 km NV for Otta (prøve nr. 536). Ved Nysetermoen, 3 km lengre mot SØ, er det et par høye prøver med opptil 350 ppm Cu. Ved Veggemskampen, ca. 6 km rett vest for Otta, er det en anomali med opp til 300 ppm Cu, prøve nr. 2843.

På Sognefjellet er det en anomali øst for Preststeinsvatnet med et par prøver med mellom 300 og 400 ppm Cu (prøve nr. 2774 og

2775). I samme området, men litt lengre øst og nordøst er det prøver med henholdsvis 250 ppm Cu (prøve nr. 3193) ved Bøverbreen og 160 ppm Cu (prøve nr. 2750) ved Nufsfonni.

Kobolt Tegning 1709/F-23 og 1709/F-24. Tegningene er ikke vedlagt rapporten, men kan skaffes fra NGU. Sedimentprøvene har en medianverdi på ca. 12 ppm Co og de fleste prøvene har verdier mellom 5 og 30 ppm Co. Eneste nevneverdige koboltanomali opptrer ved Tokampen som ligger et par km sydøst for Otta. To av verdiene her når opp i henholdsvis 300 og 400 ppm Co (prøve nr. 415 og 413).

Krom Tegning 1709/F-25 og 1709/F-26. Tegningene er ikke vedlagt rapporten, men kan skaffes fra NGU. Sedimentprøvene har en medianverdi på ca. 15 ppm Cr. Imidlertid har prøvene fra "Sygnefjell" et langt lavere kromnivå enn prøvene fra "Otta-Vågå". Det skyldes innslaget av serpentin/kleber-bergarter som opptrer i et belte fra Vågåvatn sydøstover mot Otta. Her er kromverdier på flere hundre ppm Cr, mens en særlig på "Sygnefjell" har et stort antall verdier under påvisningsgrensen på 0.3 ppm Cr.

Elementet krom er svært sterkt bundet i prøvene og bare en liten del (10-20%) av krominnholdet løses ut med den anvendte analysemetoden (Faye 1982). Analyseverdiene er derfor langt fra totalverdier. I denne undersøkelsen anvendes ikke kromverdiene til å indikere forekomster av krommalm, men hovedsaklig til å avgjøre i hvilken grad serpentin/kleber er tilstede i prøven.

Magnesium Tegning 1709/F-27 og 1709/F-28. Tegningene er ikke vedlagt rapporten, men kan skaffes fra NGU. Sedimentprøvene har en medianverdi på ca. 0.7% Mg og de fleste prøvene har verdier mellom 0.2 og 1.5% Mg. Magnesium er et vanlig bergartsdannende element og fordelingen av magnesium er først og fremst til nytte i kartlegging av bergartsgrenser.

Mangan Tegning 1709/F-29 og 1709/F-30. Tegningene er ikke vedlagt rapporten, men kan skaffes fra NGU. Sedimentprøvene har en medianverdi på ca. 0.1% Mn, men varierer forholdsvis mye. Prøvene fra Sognefjell har et lavere mangannivå enn prøvene fra "Otta-Vågå". De fleste prøvene har verdier mellom 0.01 og 1% Mn. I denne undersøkelsen er det ikke aktuelt å nytte manganverdiene til leting etter manganmalm, men verdiene kan være til nytte ved påvisning av utfellingbelegg som ofte skaper falske anomalier.

Molybden Tegning 1709/F-31 og 1709/F-32. Tegningene er ikke vedlagt rapporten, men kan skaffes fra NGU. Sedimentprøvene har en medianverdi på omlag 1 ppm Mo og en stor del av prøvene har analyseverdier under påvisningsgrensen på 0.3 ppm Mo. Bare svært få prøver inneholder mere enn 10 ppm Mo. De høyeste er på rundt 40 ppm Mo og opptrer ved Vålåsjøberget (prøve nr. 2364), Veggemskampen (prøve nr. 456) og syd for Tesse (prøve nr. 817). Fluktuasjoner i analyseinstrumentet kan ha skapt variasjoner i analyseverdiene på opptil 5-10 ppm Mo. Siste halvdel av bekkesedimentprøvene (prøvenummer over 2000) har trolig av den grunn fått noen ppm Mo høyere analyseverdier enn tilsvarende prøver med lavere prøvenummer. Det bør derfor utvises forsiktighet ved tolking av forskjeller på 5-10 ppm Mo.

Natrium Tegning 1709/F-33 og 1709/F-34. Tegningene er ikke vedlagt rapporten, men kan skaffes fra NGU. Sedimentprøvene har en medianverdi på ca. 400 ppm Na og de fleste prøvene har verdier mellom 100 og 800 ppm Na. Natrium er et svært vanlig bergartdannende element som finnes i store mengder i de fleste bergarter. Bare en liten del av det totale Na-innholdet i bekkesedimentene løses ut med den anvendte analysemetoden og analyseverdiene angir derfor ikke totalinnholdet i prøvene. Dessuten inneholder oppsluttningsglassene som brukes ved denne analysemetoden 5-10% Na. Forurensningene fra reagensglassene kan derfor innvirke på analyseverdiene med flere hundre ppm Na (Faye 1983). Na-verdiene er derfor ikke av interesse ved denne typen undersøkelser og de er tatt med her hovedsaklig fordi analyseinstrumentet automatisk bestemmer disse verdiene samtidig med de andre elementene.

Nikkel Tegning 1709/F-06 og 1709/F-10. Tegningene er vedlagt rapporten. Sedimentprøvene har en medianverdi på ca. 30 ppm Ni og de fleste prøvene har verdier mellom 5 og 120 ppm Ni. Prøvene fra "Sygnefjell" har lavere nikkelinnhold enn prøvene fra "Otta-Vågå". Det skyldes for en stor del innslaget av serpentin/-kleber-bergarter som inneholder mye nikkel og som opptrer i et belte fra Vågåvatn sydøstover mot Otta. Den høyeste Ni-verdien opptrer ved Veggemskampen, ca. 6 km rett vest for Otta, og er på ca. 0.24% Ni (prøve nr. 456). Ved Tokampen, ca. 2 km vest for Otta, er det også flere høye verdier med opptil 0.12% Ni (prøve nr. 412). Verdier rundt 400 ppm Ni opptrer dessuten ved Vålåsjøberget, syd for Vågåmo og sydøst for Flatingen.

Silisium Tegning 1709/F-35 og 1709/F-36. Tegningene er ikke vedlagt rapporten, men kan skaffes fra NGU. Sedimentprøvene har en medianverdi som ligger under påvisningsgrensen på 100 ppm Si. Den høyeste verdien er på 300 ppm Si. Silisium er omtrent

uløselig ved den anvendte oppslutningsprosedyren og totalinnholdet av silisium i bekkesedimenter er derfor omtrent tusen ganger større enn de oppgitte verdiene. Disse verdiene har bl.a. av den grunn liten interesse ved leting etter sulfidforekomster.

Sink Tegning 1709/F-07 og 1709/F-11. Tegningene er vedlagt rapporten. Sedimentprøvene har en medianverdi på ca. 60 ppm Zn og de fleste prøvene har verdier mellom 10 og 200 ppm Zn. Forurensningene fra Selsgruvene, like øst for Otta gir analyseverdier opp til 1600 ppm Zn. Foruten gruveforurensningene opptrer den høyeste sinkverdien på ca. 800 ppm Zn (prøve nr. 2364) ved Vålåsjøberget som ligger ca. 6 km øst for Otta. En sinkverdi på ca. 500 ppm Zn opptrer ca. 3 km sydøst for Flatingen (prøve nr. 3264). Forøvrig opptrer mange verdier på flere hundre ppm Zn innen området.

Strontium Tegning 1709/F-37 og 1709/F-38. Tegningene er ikke vedlagt rapporten, men kan skaffes fra NGU. Sedimentprøvene har en medianverdi på ca. 50 ppm Sr og de fleste prøvene har verdier mellom 20 og 200 ppm Sr. Strontium egner seg ikke som sporelement i leting etter sulfidforekomster, men kan nyttes til å finne bergartsgrenser.

Sølv Elementet er ikke framstilt på kart. Sedimentprøvene har en medianverdi på omlag 0.5 ppm Ag. De fleste prøvene har verdier mellom 0.1 og 1.0 ppm Ag. Sølv ble analysert for å finne eventuelle spor etter edelmetallforekomster. Høyeste analyseverdi er på 2.0 ppm Ag og opptrer 7 km rett vest for Sjoa (prøve nr. 2649). Den nest høyeste er på 1.7 ppm Ag og opptrer ved Veggemskampen (prøve nr. 456). Ingen av prøvene er høye nok til å være av særlig interesse.

Titan Tegning 1709/F-39 og 1709/F-40. Tegningene er ikke vedlagt rapporten, men kan skaffes fra NGU. Sedimentprøvene har en medianverdi på ca. 800 ppm Ti og de flest prøvene har verdier mellom 300 og 2000 ppm Ti. Bare en liten del av det totale innholdet av titan i bekkesedimentene løses ut ved den anvendte analysemetoden. Titan egner seg dårlig som sporelement ved leting etter sulfidforekomster.

Uran Tegning 1709/F-41 og 1709/F-42. Tegningene er ikke vedlagt rapporten, men kan skaffes fra NGU. Sedimentprøvene har en medianverdi på ca. 0.5 ppm U og de fleste prøvene har verdier mellom 0.1 og 6 ppm U. Urananalysene ble utført for å finne spor etter eventuelle uranforekomster. Den mest markerte urananomalien opptrer i området Lemonsjøen - Tesse der den høyeste uranverdien når opp i 62 ppm U (prøve nr. 1192). Ved Skaalavatnet på Sognefjellet opptrer et par høye verdier med opptil 47 ppm U (prøve nr. 3529). Ved Veggemskampen inneholder en prøve 33 ppm U (prøve nr. 456). Forøvrig opptrer flere steder innen området enkeltverdier rundt 10 til 20 ppm U.

Vanadium Tegning 1709/F-43 og 1709/F-44. Tegningene er ikke vedlagt rapporten. Sedimentprøvene har en medianverdi på ca. 30 ppm V og de fleste prøvene har verdier mellom 10 og 70 ppm V. Vanadiumverdiene anses ikke å være av særlig verdi ved denne undersøkelsen.

6. ANOMALE OMRÅDER

Området ved Gnedden Området ligger ca. 6 km SØ for Otta. Den øverste prøven (nr. 2843) i bekken som renner på østsida av Gnedden inneholder ca. 300 ppm Cu. Innholdet av de øvrige elementene i prøven er lavt, innkludert jern, mangan og organisk materiale. Ingen av de nedenforliggende prøvene inneholder høye verdier verken av kobber eller de øvrige elementene. Kobberverdiene ble fulgt opp med geofysikk, geokjemi og geologi (NGU-rapport nr. 1709/L).

Området ved Heimtjern Området ligger ca. 4 km SØ for Otta. Like nedenfor Slettetoppen inneholder en prøve (nr. 2416) 72 ppm Pb og 204 ppm Zn. På grunn av samtidig høyt innhold av organisk materiale, 35%, og med jerninnhold på 5.3% Fe ble ikke blyverdiene tillagt særlig vekt og nærmere undersøkelser ble ikke planlagt. Men da geofysiske målinger i området ga en VLF-anomali like ovenfor denne prøven, ble bekken undersøkt nærmere (NGU-rapport nr. 1709/L).

Området ved Vålåsjøberget Området ligger ca. 6 km øst for Otta. Den øverste prøven i en bekk som renner på østsida av Vålåsjøberget inneholder bl.a. 820 ppm Zn, 270 ppm Pb, 150 ppm Co, 46 ppm Mo, 570 ppm Ba, 2.3% Mn, over 8% Fe og 11% organisk innhold. Området ble undersøkt med geofysikk, geokjemi og geologi (NGU-rapport nr. 1709/L).

Området ved Gråhø Området ligger ca. 2 km nord for Vålåsjøberget. På vestsida av Gråhø renner en bekk med 6 sedimentprøver etter hverandre med henholdsvis 168, 321, 306, 178, 99 og 105 ppm Zn. Det er først og fremst sinkverdiene som er høyere enn

vanlig, men også bariumverdiene når opp i 300 ppm Ba i de to øverste prøvene. I tillegg når jernverdiene opp i over 8% Fe og organisk materiale opp i 36%. Området ble undersøkt med geofysikk og geokjemi (NGU-rapport nr. 1709/L).

Området ved Pungen Området ligger 6-7 km øst for Otta. Her er det 4 prøver med fra 100 til 150 ppm Pb. Forøvrig er det ingen andre elementer som er over det normale. Området ble fulgt opp med geofysikk, geokjemi og geologi (NGU-rapport nr. 1709/L).

Området ved Veggemskampen Området ligger ca. 6 km rett vest for Otta. På sydsida av Veggemskampen renner en bekk som inneholder opptil 0.24% Ni, 300 ppm Cu, 0.15% Ba, over 8% Fe og 34% organisk materiale, men lave Cr- og Mg-verdier. Området ble fulgt opp med geofysikk, geokjemi og geologi (NGU-rapport nr. 1709/L).

Området ved Haldorpiggen Området ligger ca. 5 km NNØ for Otta. På vestsida av Haldorpiggen er det en prøve som inneholder 80 ppm Pb, men forøvrig ingen andre høye verdier. Området ble fulgt opp geologisk, geokjemisk og geofysisk (NGU-rapport nr. 1709/L).

Området ved Svarttjern Området ligger ca. 16 km nordvest for Otta. En prøve (nr. 536) fra sydsida av Tolstadkampen inneholder ca. 600 ppm Cu og ca. 50% organisk materiale. Forøvrig er ingen andre elementer spesielt høye. Området ble fulgt opp med geofysikk, geokjemi og geologi (NGU-rapport nr. 1709/L).

Området ved Tokampen Området ligger ca. 2 km vest for Otta. På østsida av Tokampen renner en bekk med opptil 0.12% Ni, 400 ppm Co og 130 ppm Cr. Området ble senere målt med bakkegeofysikk (NGU-rapport nr. 1709/L).

Området sydøst for Flatingen Området ligger ca. 3 km sydøst for Flatingen. En av prøvene (nr. 3264) inneholder ca. 400 ppm Ni, 500 ppm Zn og 0.23% Ba. Området ble ikke nærmere undersøkt.

Området ved Kvitingen Området ligger ca. 1 km vest for Flatingen. En av prøvene (nr. 3675) inneholder 230 ppm Ni, 185 ppm Zn og 600 ppm Ba. Området ble nærmere undersøkt geofysisk og geologisk (NGU-rapport nr. 1709/L).

Området Lemonsjøen - Tesse Området ligger ved den sydlige delen av de to sjøene Lemonsjøen og Tesse. Flere prøver har her høyere uraninnhold enn vanlig og en av prøvene fra en bekk som renner inn i Lemonsjøen inneholder 62 ppm U. Urananomalien ble nærmere undersøkt av geolog Jens Hysingjord fra NGU. Han fant at de høye verdiene trolig skyldes høyt uraninnhld i en grafittskifer i området. Grafittskiferen har ikke økonomisk interesse.

Området ved Råsdalsfjell Området ligger ca. 7 km nordvest for Otta. En prøve (nr. 292) inneholder vel 100 ppm Cu. I samband med andre undersøkelser i nabolaget ble dette området undersøkt geofysisk, geokjemisk og geologisk (NGU-rapport 1709/I).

Området ved Nysetermoene Området ligger ca. 10 km nordvest for Otta. Her er det særlig kobberinnholdet som er over det normale. Den høyeste kobberverdien er på 350 ppm Cu (prøve nr. 400). Sinkverdiene når opp i ca. 250 ppm Zn. Området ble fulgt opp med geofysikk, geokjemi og geologi (NGU-rapport nr. 1709/I).

Området ved Preststeinsvatnet - Bøverbreen Området ligger på sydøst-sida av riksveien over Sognefjellet (Tegning 1709/F-03). Et forhøyet kobbernivå følger kanten av jotundekket og den høyeste kobberverdien opptrer øst for Preststeinsvatnet og er på ca. 400 ppm Cu (prøve nr. 2775). Nord for Bøverbreen er det en kobberverdi på ca. 250 ppm Cu (prøve nr. 3193), og nord for Nufsfonni er det en prøve på 160 ppm Cu (prøve nr. 2750). Området ble fulgt opp med geofysikk, geokjemi og geologi (NGU-rapport nr. 1709/P).

Området Skålavatnet - Dummdalen Området ligger langs vestsida av det prøvetatte området på Sognefjellet. Det er først og fremst blyverdiene som er høyere enn vanlig med den høyeste verdien på 280 ppm Pb nord for Skaalavatnet (prøve nr. 3578) og på 230 ppm Pb i Dummdalen (prøve nr. 3129). Området ble fulgt opp med geofysikk og geologi (NGU-rapport nr. 1709/P).

Området nord for Vågåvatn Ett av de mest interessante malmletingsområdene i Nord-Gudbrandsdalen er bergartsgrensen mellom kambrosilur og eokambrium som går nordover fra Vågåvatn (Tegning 1709/F-04). Både i Norge og Sverige er det funnet mange blymineraliseringer i tilsvarende soner. Den interessante bergartsgrensen nord for Vågåvatn var tidligere delvis prøvetatt av A/S Folldal Verk (Tegning 1709/F-01), men uten at prøvene var analysert på bly. Det ble derfor gjort en avtale mellom A/S

Folldal Verk og NGU. NGU skulle få låne det aktuelle prøvemateriale for analyse på bly slik at det bare var nødvendig med kompletterende prøvetaking som vist på tegning 1709/F-04. Uheldigvis har A/S Folldal Verk i mellomtida mistet sitt prøvemateriale slik at blyundersøkelsen er blitt vesentlig amputert. Blant analyseverdiene fra NGUs prøver fra området ble det ikke funnet høye blyverdier eller andre høye verdier. Men det bør overveies ny prøvetaking i området for å erstatte de prøvene A/S Folldal Verk har mistet langs bergartsgrensen mellom kambro-silur og eokambrium.

Området ved Muslidalen Før A/S Folldal Verk mistet sine prøver hadde de utført analyser på Cu, Ni og Zn. De fikk nikkelverdier på rundt 200 ppm Ni, bl.a. ved Muslidalen, ca. 15 km nord for Vågåmo, tegning 1709/F-4.

For bedre å klarlegge prøvetypen og årsaken til disse verdiene tok NGU 12 nye bekkesedimentprøver som ble analysert på de vanlige elementene, tekstbilag 2. Analysene viste at både krom og magnesium er høye i disse prøvene. Forvitringsmateriale av serpentin/kleber-bergarter antas derfor å være årsak til nikkelverdiene.

7 KONKLUSJON

Ved den regionale bekkesedimentundersøkelsen i Nord-Gudbrandsdalen ble det funnet flere områder med forhøyede analyseverdier som ble fulgt opp med nærmere undersøker. Disse undersøkelsene omtales i NGU-rapport nr. 1709/I, NGU-rapport nr. 1709/L og NGU-rapport nr. 1709/P.

Forøvrig gjenstår utfyllende prøvetaking av et påbegynt, smalt område som strekker seg fra Trælviki ved Vågåvatn, nordover til Skaihø, Gravdalen og Nonshøi. Dette området bør få høy prioritet ved senere undersøkelser i Nord-Gudbrandsdalen.
