Summary: The Geological Survey of Norway is in the process of making out an inventory of hard rock aggregate deposits in coastal Norway. This report contains a catalogue of Norwegian coastal quarries at present in production and potential production areas along the coast of southern Norway and Finnmark. 9 million tons of aggregate were exported to Europe in 1999 and ca. 5.1 million tons were used in the offshore industry (continental shelf).

Maps of quarries and potential deposits of hard rock aggregate and sand/gravel in South Norway	20

INTRODUCTION

The Norwegian production in 1999 of hard rock aggregate was ca. 39 million tons and sand/gravel 23 million tons.

9 million tons of aggregate and 0.3 million tons of sand and gravel were exported with an export value of NOK 452 million from 20 hard rock aggregate- and 4 sand and gravel producers from Halden in Østfold county to Sogn and Fjordane (statistics compiled by NGU and the producers), page 5 - 7. The export of hard rock aggregate represents 23 % of the total production. The majority of the quarrying companies are relatively small, catering essentially for local needs. There are, however, a number of major players including Oster Pukk og Grus A/S, NorStone, Kolo-Veidekke A.S, Rieber & Søn ASA Fjordstein A/S, Halsvik Aggregates A/S and Franzefoss Bruk A/S. These companies each have an annual production in the order of 1-2 million tons. The largest individual aggregate quarry (gneiss) owned by Norsk Stein A/S had a production of approx. 2.6 million tons in 1999. The offshore production of aggregates in 1999 mostly to Norwegian sectors was 5.1 million tons. The sand- and gravel export is from three quarries in Rogaland and one in Sogn and Fjordane county.

Norway is probably northern Europe's principal **hard rock** country being composed almost entirely of Precambrian and Palaeozoic igneous and metamorphic rocks. Norway has a long, indented and rugged coastline where a considerable variety of rocks suitable for aggregate production are well exposed. Deep-water anchorage, low tidal range and a well-developed infrastructure allow for planning of harbour facilities for medium-large size bulk carriers. Norway has an attractive investment and taxation climate and overseas investment is encouraged. National and local authorities are aware of the potential for the development of large coastal quarries (super-quarries) designed for the production and export of rock aggregates. The Geological Survey of Norway (NGU) is undertaking a number of investigations of potential coastal sites for such quarries, so that local government planners, can classify such sites for future development. In Bremanger kommune two new quarries are in planning and will start production in 2000/2001 of green sandstone with PSV form 58-62.

NGU is planning to map together with counties, communes and the industry potential coastal rock units for which environmental, topographic and transport criteria would allow quarrying.

The Gravel- and Aggregate database has been on internet from January 1999, <http://grusogpukk.ngu.no/> or <http://www.ngu.no>

The next report will come in April 2001.

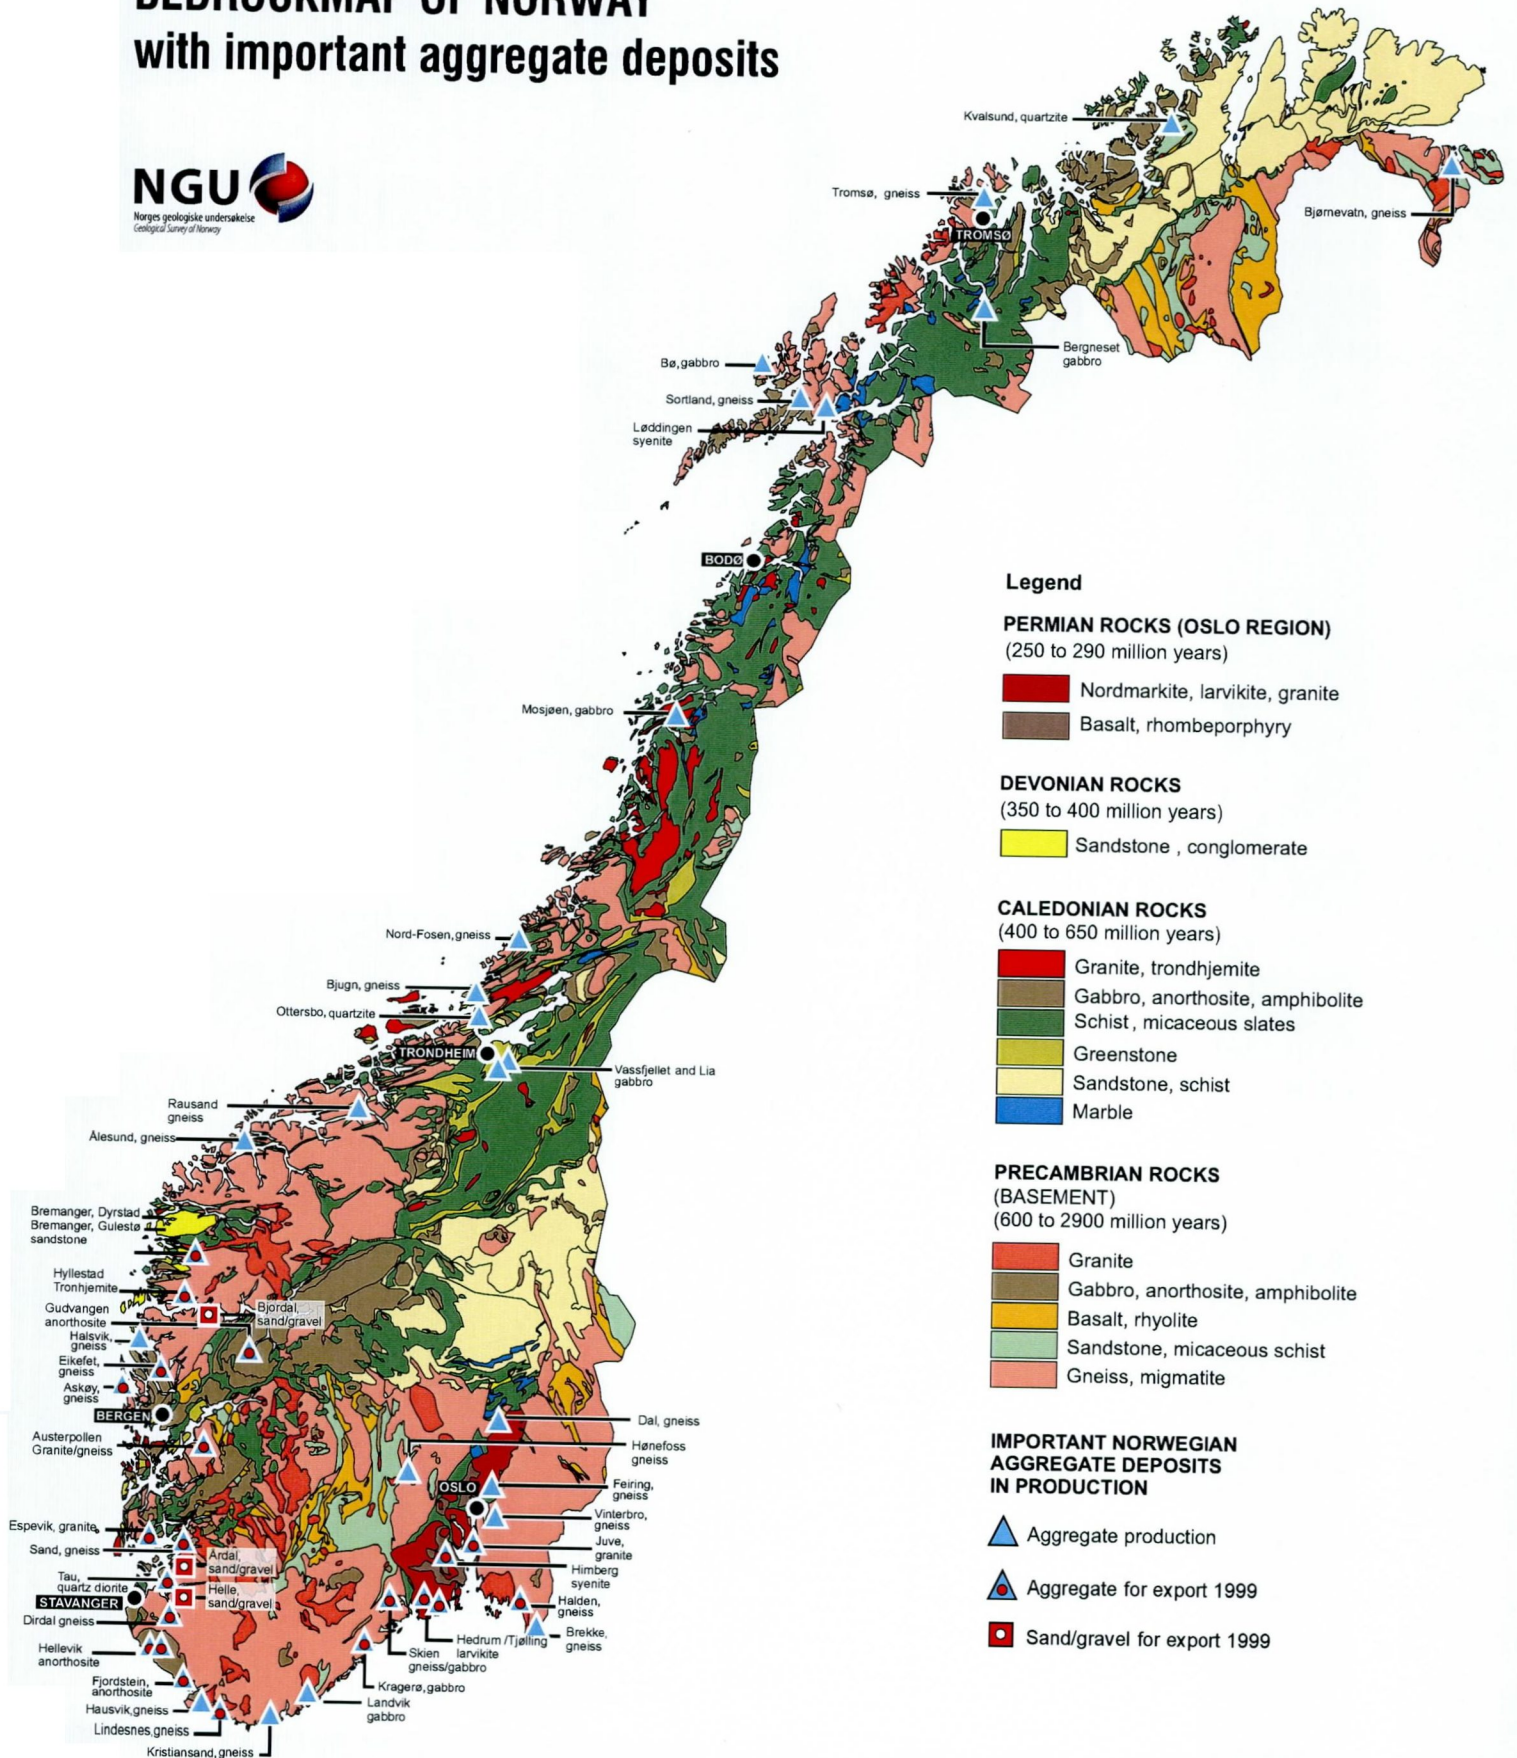

Trondheim, 8th April 2000
